

## Midday GFS Model Summary (Any changes to FW Forecast Maps will appear in full Midday Update)

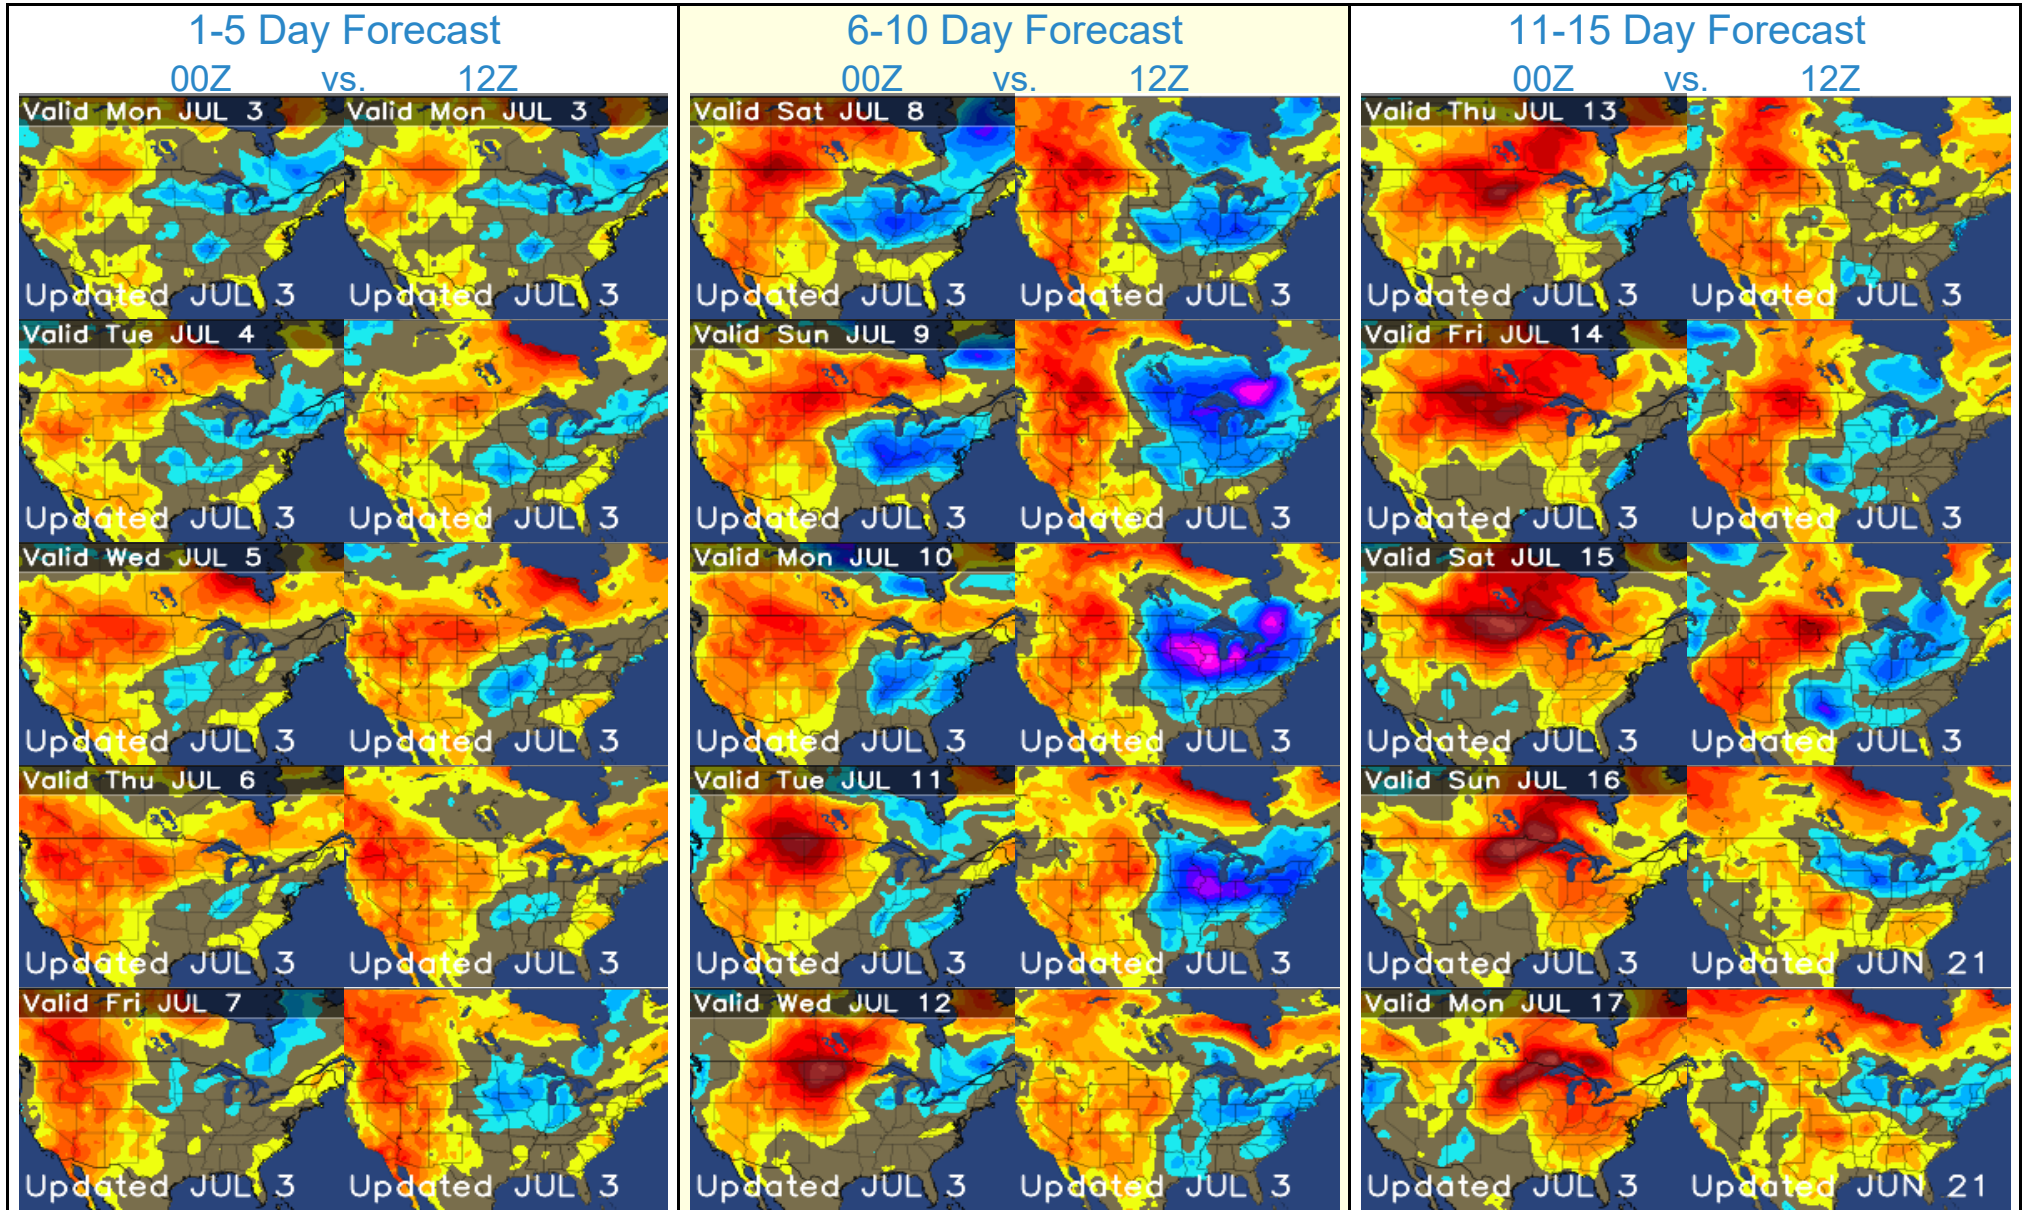

The latest GFS run doesn't have any significant near-term changes from earlier, but it is quite a bit cooler across the eastern half of the country in the 6-10 day period than earlier runs. Given the recent pattern, keeping the western ridge in place longer isn't an unreasonable solution, but the new GFS run does look too aggressive in cooling the eastern half of the US and at least a more seasonal pattern like this week is favored. While the new GFS run does build some heat eastward in the 11-15, the cooler temps in the 6-10 carry over into the 11-15 resulting in a more seasonal Midwest and Northeast. The southern portions of the Plains as well as the Southwest are a little hotter, however.
